

Table 1: Digital friction experiment (Stage 6, single-stage 10-day, logical clock): world-level outcomes and paired effects vs baseline

Panel A. Absolute outcomes across worlds (mean±SD over 3 seeds)						
World	Attempt rate	Success rate	Help-seek rate	Abandon rate	Neg. share	Helplessness Δ
Baseline (Low Friction)	0.680±0.014	0.378±0.014	0.394±0.020	0.083±0.017	0.443±0.010	32.789±1.821
High Friction + Low Assist	0.331±0.045	0.036±0.009	0.212±0.025	0.106±0.024	0.893±0.021	51.403±0.161
High Friction + High Assist	0.564±0.043	0.204±0.004	0.377±0.053	0.119±0.018	0.638±0.020	47.434±5.603
Low Friction + High Assist	0.789±0.030	0.574±0.033	0.474±0.026	0.035±0.007	0.274±0.019	5.631±2.863
Panel B. Paired effects vs baseline (mean difference [95% CI], n=3 pairs)						
Contrast vs baseline	Δ Attempt rate	Δ Neg. share	Δ Helplessness	Δ Trust	Δ Avoidance	
High Friction + Low Assist	-0.349 [-0.390, -0.301]	+0.449 [+0.418, +0.472]	+18.614 [+16.829, +20.143]	-19.783 [-20.425, -19.400]	+7.167 [+4.850, +8.350]	
High Friction + High Assist	-0.116 [-0.144, -0.078]	+0.195 [+0.171, +0.219]	+14.645 [+9.296, +18.175]	-22.017 [-29.950, -14.575]	+12.033 [+4.325, +17.650]	
Low Friction + High Assist	+0.109 [+0.093, +0.133]	-0.170 [-0.181, -0.155]	-27.158 [-30.085, -24.262]	+40.083 [+34.625, +44.000]	-35.408 [-41.475, -30.375]	

Notes. Experiment setup from manifest/config: 4 worlds, 3 paired seeds (101/102/103), 10 agents per world, single stage (steady), 10 days, 30-minute decision interval. All paired QC rows pass (`qc_pass=1`). Wilcoxon p-values in paired stats are 0.25 for nonzero contrasts (small-sample limit at n=3), so Panel B is primarily descriptive about effect direction and magnitude.
